## USE ONLY FOR FILING A PROVISIONAL APPLICATION FOR PATENT

This collection of information is required by 37 CFR 1.51. The information is used by the public to file (and by the PTO to process) a provisional application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 8 hours to complete, including gathering, preparing, and submitting the complete provisional application to the PTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Tract mark Office, U.S. Department of Commerce, Washington, D.C. 20231. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDITING. SEND TO: Box Provisional Application, Assistant Commissioner for Patents, Washington, D.C.

Approved for use through 04/30/2003. OMB 0651-0032

Patent and Trademark Office: U.S. DEPARTMENT OF COMMERCE

Patent and Trademark Office: U.S. DEPARTMENT OF COMMERCE

Interview of the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a collection.

| 8       | Not applicable.   |
| 9<br>10 | FIELD OF THE INVENTION  |
| 11      | The present invention relates to articles of manufacture for inhibiting the explosion of            |
| 12      | flammable fluids contained in closed containment vessels and, in particular, for inhibiting boiling |
| 13      | liquid, expanding vapor explosions.   |
| 14      |   |
| 15      | BACKGROUND OF THE INVENTION   |
| 16      | Previous approaches to inhibiting the explosion of flammable liquid vapors, especially to           |
| 17      | inhibiting boiling liquid expanding vapor explosions, have failed to take into account the          |
| 18      | settlement and the compaction of explosion mitigation devices during the service of those           |
| 19      | devices.  |
| 20      |   |
| 21      | SUMMARY OF THE INVENTION  |
| 22      | The present invention comprises an article of manufacture comprising an apertured sheet             |
| 23      | material, the sheet material being provided with at least one row of a plurality of polygonal       |

| 1    | apertures, at least one of said polygonal apertures being irregular with respect to at least one |
|------|--|
| 2    | adjacent polygonal aperture, and having physical characteristics comprising                      |
| 3    | i. a surface area per unit volume of application of at least about 2,000 times the contact       |
| 4    | surface of flammable fluids contained in a containing vessel,                                    |
| 5    | ii. a heat conductivity of at least about 0.025 Cal/cm-sec.                                      |
| 6    | Preferably, the inner peripheral length of at least one of the apertures is unequal to the inner |
| 7    | peripheral length of at least one adjacent aperture. Further, the article preferably has a       |
| 8    | compressive yield of not more than about 10 percent.   |
| 9    | In another embodiment, the foregoing sheet material is in the form of a cylindrical roll o       |
| 10   | bale   |
| 11   | In a further embodiment, the foregoing sheet material is in the form of a spheroid               |

#### DESCRIPTION OF THE PREFERRED EMBODIMENTS

| 2  | The present invention comprises, as an article of manufacture, an apertured sheet material,        |
|----|--|
| 3  | the sheet material being provided with at least one row of a plurality of polygonal apertures, at  |
| 4  | least one of said polygonal apertures being irregular with respect to at least one adjacent        |
| 5  | polygonal aperture, and having physical characteristics comprising                                 |
| 6  | i. a surface area per unit volume of application of at least about 2,000 times the contact         |
| 7  | surface of flammable fluids contained in a containing vessel,                                      |
| 8  | ii. a heat conductivity of at least about 0.025 Cal/cm-sec.  |
| 9  | Preferably, the inner peripheral length of at least one of the apertures is unequal to the inner   |
| 10 | peripheral length of at least one adjacent aperture. Further, the article preferably has a         |
| 11 | compressive' yield of not more than about 10 percent.  |
| 12 | In this way, an apertured sheet material is provided that produces a configuration that is         |
| 13 | resistant to settling and to compaction. Such an article of manufacture is helpful in inhibiting a |
| 14 | flammable fluid explosion in a closed containment vessel containing flammable fluid,               |
| 15 | particularly in inhibiting a boiling liquid, expanding vapor explosion (or "BLEVE".)               |
| 16 | A sheet material for use in the present invention, and as illustrated in Figs. 1 & 2 by way        |
| 17 | of example, comprises a sheet 1 of heat-conductive material, preferably having the aforesaid       |
| 18 | physical properties. The sheet has a flat, generally planar configuration with a thickness from    |
| 19 | about 0.01 mm (1 micron) to about 0.1 mm (10 microns), desirably from about 0.03 mm (3             |
| 20 | microns) to about 0.07 mm (7 microns) and preferably from about 0.04 mm (4 microns) to about       |
| 21 | 0.05 mm (5 microns).   |
| 22 | The sheet material desirably has good heat conductivity in order to adequately dissipate           |
| 23 | heat in inhibiting the explosion of flammable fluids contained in closed containers, particularly  |

for inhibiting BLEVEs. The heat conductivity should be at least about 0.025 Cal/cm-sec, 1 particularly for materials with a specific density of from about 2.8 g/cm<sup>3</sup> to about 19.5 g/cm<sup>3</sup>, 2 and preferably from about 0.025 to about 0.95 Cal/cm-sec, particularly for materials with a 3 specific density of from about 2.8 g/cm<sup>3</sup> to about 19.5 g/cm<sup>3</sup> 4 The heat conductivity is nominally about 2.36 Watt/cm-deg (Kelvin) at 273 T.K. (degrees 5 Kelvin) (for Aluminum)-The following can be used as candidate alloy or raw materials 6 depending on the application: 7 Silver 4.28 Watt/cm-deg (Kelvin) at 273 T.K., 8 Gold 3.2018 Watt/cm-deg (Kelvin) at 273 T.K., 9 Copper 4.1 Watt/cm-deg (Kelvin) at 273 T.K., 10 Stainless Steel 0.835 Watt/cm-deg (Kelvin) at 273 T.K., and 11 polymeric material 12 for a material with a density, for example, of 2.7 g/cm<sup>3</sup> (Al); 10.5 g/cm<sup>3</sup> (Silver), 19.3 g/cm<sup>3</sup> 13 (Gold), 8.92 g/cm<sup>3</sup> (Copper), 7.86 g/cm<sup>3</sup> (Stainless Steel) or 0.9 to 1.5 g/cm<sup>3</sup> (polymeric 14 15 material. The sheet material is desirably relatively chemically inert to the contents of the closed 16 container for the service life of the container and/or the residence period of the contents in the 17 container. Materials may be metals and metallic alloys, such as aluminum, magnesium, copper, 18 gold, silver or stainless steel, or nonmetallics, such as polymeric or plastic materials. 19 A slit sheet material for use in the present invention, and as is illustrated in Figs. 3, 4 & 5 20 by way of example, comprises a sheet material 10 having a plurality of parallel lines P (Fig. 3) of 21 elongated rectangular apertures 12, preferably slots. Each rectangular aperture 12, and each line 22 P of rectangular apertures 12, extends parallel to the longitudinal central axis of the sheet. Each 23

## TEN THE DESIGNATION OF THE STOLL, MISKIN & BADIE DOCKET: 576391-2001

| 1  | rectangular aperture 12 in a line P of rectangular apertures 12 is spaced from the rectangular       |
|----|--|
| 2  | aperture 12 preceding it and the rectangular aperture 12 following it by an intermediate web 14      |
| 3  | of solid, imperforate sheet material. In other words, in proceeding longitudinally along a line P of |
| 4  | rectangular apertures 12, there is a rectangular aperture 12 followed by an intermediate web 14,     |
| 5  | followed by a rectangular aperture 12 followed by an intermediate web 14, et cetera.                 |
| 6  | In forming a sheet with polygonal apertures, the intermediate webs 14 of adjacent lines of           |
| 7  | rectangular apertures are offset with respect to each other so that in proceeding transversely       |
| 8  | across the sheet along a line T that is perpendicular to the longitudinal central axis of the sheet  |
| 9  | and that passes through an intermediate web 14 of an adjacent longitudinal line P of rectangular     |
| 10 | apertures 12,  |
| 11 | a. the transverse line T will pass across a rectangular aperture 12 of the next adjacent             |
| 12 | longitudinal line P of rectangular apertures 12,   |
| 13 | b. then through an intermediate web 14 of the next adjacent longitudinal line P of                   |
| 14 | rectangular apertures 12,  |
| 15 | c. then across a rectangular aperture 12 of the next adjacent longitudinal line of rectangular       |
| 16 | apertures, et cetera.  |
| 17 | In this way, the longitudinally extending rectangular apertures 12 alternate with                    |
| 18 | intermediate webs 14 transversely across the sheet 10.   |
| 19 | Preferably, the length of each longitudinally extending rectangular aperture 12 in                   |
| 20 | proceeding along a transverse line T of rectangular apertures 12 should be different from the        |
| 21 | length of the rectangular aperture 12 preceding it and the length of the rectangular aperture 12     |
| 22 | following it. In other words, the length of each longitudinally extending rectangular aperture 12    |
| 23 | is preferably different from the length of the next adjacent longitudinally extending rectangular    |

## 6114 MARTINGONE GHE 12112

DOCKET: 576391-2001

aperture 12 in a transverse line T across the width of the sheet. Further, with respect to each rectangular aperture 12, the length of each of the four most adjacent rectangular apertures 12 in 2 the two most adjacent longitudinal lines P of rectangular apertures 12 should preferably also be 3 different from that of the rectangular aperture 12. 4 The lengths of the respective longitudinally extending rectangular apertures 12 in a 5 transverse line T across the width of the sheet may be random with respect to each other. 6 Alternatively, the lengths of each respective longitudinally extending rectangular aperture 12 7 may increase progressively in length in a transverse line T across the width of the sheet or 8 decrease in length. In one alternative embodiment, the lengths of each respective longitudinally 9 extending rectangular aperture 12 increase progressively in length in a transverse line T across 10 the width of the sheet and the lengths of each respective longitudinally extending rectangular 11 aperture 12 in the next adjacent transverse line T decreases progressively in length across the 12 13 width of the sheet. The length of the apertures 12 is nominally from about 10 to about 15 mm., desirably 14 from about 12 mm. to about 15 mm., and preferably, from about 13 mm. to about 15 mm. In this 15 way, an aperture of 10 mm. might be followed by one of 10.033 mm, followed by one of 10.06 16 17 mm. The width of each rectangular aperture, or slot, may be from about .02 mm. to .06 mm, desirably from about .03 mm. to about .05 mm., and, preferably, from about .04 mm. to about .05 18 19 mm. The spacing between the rows of apertures may be varied based on the properties of the 20 material used for the sheet. The intermediate web between apertures, in turn, is from about 2.5 mm to about 4.5 mm. 21 In this way, an intermediate web of 3 mm. might be followed by one of 3.5 mm, followed by one 22 23 of 4 mm.

#### GO LEEL SHOW MOON MONTH COLOR STOLL MISKIN & BADIE DOCKET: 576391-2001

In this way, irregularity is induced in the expanded apertured sheet that produces 1 configurational resistance to settling and compaction. 2 A slit sheet material for use in the present invention, and as illustrated in Figs. 6 through 3 9 by way of example, is converted into an expanded, apertured (or fenestrated) sheet material 20 4 of the present invention that is provided with a plurality of many-sided, or polygonal apertures 5 22, such as, for example and as illustrated, hexagonal apertures. At least one polygonal aperture 6 is irregular with respect to at least one adjacent polygonal aperture. 7 For example, the sum of the lengths of the inner edges of the sides of a polygonal 8 aperture 22, for example lengths 22a, 22b, 22c, 22d, 22e, and 22f in Fig. 9, determine an inner 9 peripheral length of a polygonal aperture 22. The inner peripheral length of each polygonal 10 aperture 22 in proceeding along a transverse line T of polygonal apertures 22 should be different 11 from the inner peripheral length of the polygonal aperture 22 preceding it and the inner 12 peripheral length of the polygonal aperture 22 following it. In other words, the inner peripheral 13 length of each polygonal aperture 22 is different from the inner peripheral length of the next 14 adjacent polygonal aperture 22 in a transverse line across the width of the sheet. Further with 15 respect to each polygonal aperture 22, the inner peripheral length of each of the four most 16 adjacent polygonal apertures 22 in the two most adjacent longitudinal lines of polygonal 17 apertures 22 should preferably also be different from that polygonal aperture 22. 18 The inner peripheral lengths of the respective polygonal apertures 22 in a transverse line 19 T across the width of the sheet may be random with respect to each other. Alternatively, the 20 inner peripheral lengths of each respective polygonal aperture 22 may increase progressively in 21 inner peripheral length in a transverse line T across the width of the sheet or decrease. In one 22 alternative embodiment, the inner peripheral lengths of each respective polygonal aperture 22

increase progressively in length in a transverse line T across the width of the sheet and the inner peripheral lengths of each respective polygonal aperture 22 in the next adjacent transverse line T decrease progressively in length across the width of the sheet.

The term "irregular" as it is used herein in the context of the inner peripheral length of at least one of said apertures being unequal to the inner peripheral length of at least one adjacent aperture means that the numerical value of the inequality of one inner peripheral length with respect to the other inner peripheral length is greater than the variation in inner peripheral length produce by manufacturing variation or manufacturing tolerance. In other words, the inequality is intentional rather than random or inherent manufacturing variation.

While the irregularity of at least one polygonal aperture with respect to at least one adjacent polygonal aperture has been described in terms of the inner peripheral length of at least one of said apertures being unequal to the inner peripheral length of at least one adjacent aperture, it should be understood that irregularity can also be produced in other ways, such as having a different number of sides on the polygon (such as a pentagon or a heptagon versus a hexagon) or the length of a side of a polygonal aperture being different from the corresponding side of an adjacent polygonal aperture (i.e., greater than manufacturing variation or tolerance as previously stated)or the angle between two adjacent sides of a polygonal aperture being different from the corresponding angle between the corresponding two sides of an adjacent polygonal aperture. For example, the respective lengths of the side edges of the apertures may not all be equal, i.e., at least one side may not be the same length as any of the other sides, thereby providing an aperture with a configuration such as an irregular polygon.)

In this way, when multiple expanded, apertured sheets are placed on top of each other, 1 they are unable to align polygonal apertures and nest into each other, settling and thereby 2 3 reducing the effective thickness of the multiple sheets 20. The expanded, apertured (or fenestrated) sheet material 20 of the present invention 4 desirably has a compression yield, or resistance to compaction (i.e., permanent deformation 5 under compressive load), of not more than 10 percent. Ideally, however, there is essentially no 6 7 compressive yield in service. The expanded, apertured sheet material 20 is formed by tensioning slotted sheet material 8 10 over large wheel of a varying diameter positioned in such a way as to regulate the spreading 9 of the sheet material to an additional width 50% to 100 % that of the raw sheet material width so 10 as to ensure the resulting openings form a plurality of polygonal apertures 22 as aforesaid. 11 The expanded, apertured sheet material 20 desirably has an effective surface area per unit 12 13 volume from at least about 2,000 times the contact surface of flammable liquid/vapors and gases contained in closed containers, particularly for inhibiting boiling liquid, expanding vapor 14 explosions, and preferably from at least about 3,000 times the contact surface of flammable 15 liquid/vapors and gases contained in closed containers. The term "contact surface" refers to the 16 surface area of the containment vessel that is in contact with the gaseous, aerosol or vapor phase 17 18 of the flammable fluid that is contained in the containment vessel. Normally the flammable fluids (liquid, vapor, aerosol or gas ) are in contact with the surface areas of the walls of the 19 container containing the flammable fluid. The insertion of the finished expanded, apertured sheet 20 material increases the surface area of contact with the flammable fluid by at least about 2,000 21 times this contact surface area, preferably at least about 3,000 times this contact surface area. 22 23 This ratio is significant and to compromise this proportion of contact relative to the specific fluid

DOCKET: 576391-2001

in question is to risk a BLEVE. This area varies in relation to the heat conductivity and compressive yield strength of the material used. 2 In one embodiment, expanded, apertured sheet material 20 for use in the present 3 invention, and as is illustrated in Fig. 16 by way of example, may be formed into a shape that 4 comprises a body 100 with a generally spheroidal external configuration or shape. 5 The internal configuration of the generally spheroidal body 100 comprises at least one 6 strip of the aforesaid expanded, expanded sheet material that is folded and/or crimped and 7 cupped to form said spheroidal shape. The generally spheroidal shape may be formed using a 8 section of expanded, apertured sheet material of a size proportional to about 20% of the width of 9 the expanded, apertured sheet material. 10 The outer spherical periphery of the spheroid 100 encloses a volume. The surface area of 11 the material contained within this periphery, i.e., inside the spheroid, subject to the application 12 design requirement, is at least about 1.5 square centimeters per cubic centimeter of said volume 13 or larger as required, The surface area of the material should be at least about 2,000 times the 14 contact surface of flammable fluid contained in the enclosing container of those flammable fluid, 15 particularly for inhibiting BLEVEs. 16 The spheroid 100 desirably has a compression yield, or resistance to compaction (i.e., 17 permanent deformation under compressive load), of not more than 10 percent. Ideally, however, 18 19 there is essentially no compressive yield in service. The structural strength of the final product can also be modified by using a different heat 20 hardness in the sheet material. 21 In an alternative embodiment of the present invention, expanded, apertured sheet material 22 20 for use in the present invention, and as illustrated in Figs. 10 through 12 by way of example, 23

is provided with a transverse undulating, or sinusoidal, wave 42 formed in it and the waved, 1 expanded, apertured sheet material 40, as illustrated in Figs. 13 through 15 by way of example, is 2 helically wound into a cylindrical shape 200, such as a cylindrical bale. The cylindrical shape 3 200 is generally circular in transverse section (Fig. 14) and generally rectangular in longitudinal 4 section (Fig. 15.) In a further form of this cylindrical embodiment, a flat expanded, apertured 5 sheet material may be wound into the cylindrical form. In a still further form (Figs. 13-15) of this 6 cylindrical embodiment, a sheet of flat expanded, apertured sheet material 202 and a sheet of 7 waved, expanded, apertured sheet material 204 may be wound into the cylindrical form, thereby 8 forming alternate layers of flat and waved expanded, apertured sheet material in the cylindrical 9 10 shape. Because of the wave 42 formed in the sheet material 40, with the sheet material 40 11 helically wound, the wave 42 causes an increase in the effective diameter of the cylinder 200. In 12 this way, the effective surface area contained within a given outer periphery of the cylinder 200 13 is increased. This provides large included volume cylinders 200 with low mass and high internal 14 15 effective area. The cylinder 200 desirably has a compression yield, or resistance to compaction (i.e., 16 permanent deformation under compressive load), of not more than 10 percent. Ideally, however, 17 there is essentially no compressive yield in service. 18 The imperforate starting sheet material 1 may be supplied as a continuous, non-perforated 19 web of sheet material. Then, rectangular apertures 12, or slots, are formed in the continuous web 20 in the aforesaid configuration, such as by slitting. Then, the slotted web 10 may be expanded 21 transversely by tensioning the sheet material 10 transversely, such as over a wheel positioned in 22 such a way as to regulate the spreading of the sheet material to an additional width 50% to 100 % 23

that of the raw sheet material width so as to ensure the resulting openings form a plurality of
polygonal apertures 22 of irregularity as aforesaid. Adjusting the position and tension of the
expanding wheel on the production machine does this. By doing this, the result is the ability to
have the walls of the finished honeycomb pattern more or less more erect, thereby increasing the
compressive strength of the finished expanded, apertured sheet material 20.

Optionally, the expanded, apertured web 20 may have a sinusoidal transverse wave 42 formed in it. The form of the wave 42 is introduced or impressed into the lengths of the sheet material 20 as a series of transverse kinks or waves 42 along the length of the web that looks like waves when the finished product is spooled.

Cylindrical shapes 200 may be formed by winding the aforesaid expanded, apertured sheet material.

Spheroid shapes 100 may be made by feeding the sheet material 20 provided with a plurality of rows of a plurality of parallel apertures 22, the longitudinal central of each being parallel to the longitudinal central axis of the sheet, into a machine using a mechanical device comprising two semi-circular rimmed sections with the working sections opposing each other. One is a stationary semi circular die of a variable radius with a concave working edge. The other is a rotating 360 degree circular die with a concave working edge with a friction surface. The rotation of the circular die against the fixed die forms the sheet material into a tube shape. As the sheet material is drawn through the aperture formed by the interfacing of the circular die rotating against the fixed die, the rotating die grabs a length of sheet material, determined by the material volume required for the diameters of the two semi-circular rimmed sections of the dies. and tumbles the expanded sheet material into a generally spheroidal shape.

| 1  | The expanded, apertured sheet material of the present invention may be used in the following   |

1 **CLAIMS** 2 I claim: 3 1. An explosion-inhibiting article of manufacture comprising an apertured sheet material, said 4 sheet material a. being provided with at least one row of a plurality of polygonal apertures, at least one of 5 6 said polygonal apertures being irregular with respect to at least one adjacent 7 polygonal aperture, 8 and 9 b. having physical characteristics comprising 10 i. a surface area per unit volume of application of at least about 2,000 times the contact surface of flammable fluids contained in a containing vessel, and 11 12 ii. a heat conductivity of at least about 0.025 Cal/cm-sec. 2. An explosion-inhibiting article of manufacture in accordance with claim 1, wherein the inner 13 peripheral length of at least one of said apertures is unequal to the inner peripheral length of at 14 15 least one adjacent aperture. 16 3. An explosion-inhibiting article of manufacture in accordance with claim 1, wherein the 17 material has a density from about 2.8 g/cm<sup>3</sup> to about 19.5 g/cm<sup>3</sup>. 4. An explosion-inhibiting article of manufacture in accordance with claim 1, wherein said 18 19 article has a compressive yield of not more than about 10 percent. 20 5. An explosion-inhibiting article of manufacture having a generally spheroidal shape and 21 comprising an apertured sheet material, said sheet material

| 1  | a. being provided with at least one row of a plurality of polygonal apertures, at least one of      |
|----|---|
| 2  | said polygonal apertures being irregular with respect to at least one adjacent                      |
| 3  | polygonal aperture,   |
| 4  | and   |
| 5  | b. having physical characteristics comprising   |
| 6  | i. a surface area per unit volume of application of at least about 2,000 times the contact          |
| 7  | surface of flammable fluids contained in a containing vessel, and                                   |
| 8  | ii. a heat conductivity of at least about 0.025 Cal/cm-sec.   |
| 9  | 6. An explosion-inhibiting article of manufacture in accordance with claim 5, wherein the inner     |
| 10 | peripheral length of at least one of said apertures is unequal to the inner peripheral length of at |
| 11 | least one adjacent aperture.  |
| 12 | 7. An explosion-inhibiting article of manufacture in accordance with claim 5, wherein the           |
| 13 | material has a density from about 2.8 g/cm <sup>3</sup> to about 19.5 g/cm <sup>3</sup> .           |
| 14 | 8. An explosion-inhibiting article of manufacture in accordance with claim 5, wherein said          |
| 15 | article has a compressive yield of not more than about 10 percent.                                  |
| 16 | 9. An explosion-inhibiting article of manufacture having a generally cylindrical shape and          |
| 17 | comprising an apertured sheet material, said sheet material   |
| 18 | a. being provided with at least one row of a plurality of polygonal apertures, at least one of      |
| 19 | said polygonal apertures being irregular with respect to at least one adjacent                      |
| 20 | polygonal aperture,   |
| 21 | and   |

22

b. having physical characteristics comprising

| 1  | i. a surface area per unit volume of application of at least about 2,000 times the contact          |
|----|---|
| 2  | surface of flammable fluids contained in a containing vessel, and                                   |
| 3  | ii. a heat conductivity of at least about 0.025 Cal/cm-sec.   |
| 4  | 10. An explosion-inhibiting article of manufacture in accordance with claim 9, wherein the inner    |
| 5  | peripheral length of at least one of said apertures is unequal to the inner peripheral length of at |
| 6  | least one adjacent aperture.  |
| 7  | 11. An explosion-inhibiting article of manufacture in accordance with claim 9, wherein the          |
| 8  | material has a density from about 2.8 g/cm <sup>3</sup> to about 19.5 g/cm <sup>3</sup> .           |
| 9  | 12. An explosion-inhibiting article of manufacture in accordance with claim 9, wherein said         |
| 10 | article has a compressive yield of not more than about 10 percent.                                  |
| 11 | 13. An explosion-inhibiting article of manufacture comprising an apertured sheet material, said     |
| 12 | sheet material  |
| 13 | a. being provided with at least one row of a plurality of polygonal apertures,                      |
| 14 | and   |
| 15 | b. having physical characteristics comprising   |
| 16 | i. a surface area per unit volume of application of at least about 2,000 times the contact          |
| 17 | surface of flammable fluids contained in a containing vessel, and                                   |
| 18 | ii. a heat conductivity of at least about 0.025 Cal/cm-sec,   |
| 19 | said article having a compressive yield of not more than about 10 percent.                          |
| 20 | 14. An explosion-inhibiting article of manufacture having a generally spheroidal shape and          |
| 21 | comprising an apertured sheet material, said sheet material   |
| 22 | a. being provided with at least one row of a plurality of polygonal apertures,                      |
| 23 | and   |

## STOLL, MISKIN & BADIE DOCKET: 576391-2001

| 1  | b. having physical characteristics comprising   |

| 13 | ii. a heat conductivity of at least about 0.025 Cal/cm-sec,                                 |
| 14 | said article having a compressive yield of not more than about 10 percent.                  |
| 15 |   |

#### ABSTRACT OF THE DISCLOSURE

| Articles of manufacture formed of an apertured sheet material, the sheet material being              |
|--|
| provided with at least one row of a plurality of polygonal apertures, at least one of said polygonal |
| apertures being irregular with respect to at least one adjacent polygonal aperture, and having       |
| physical characteristics comprising  |
| i. a surface area per unit volume of application of at least about 2,000 times the contact           |
| surface of flammable fluids contained in a containing vessel,  |
| ii. a heat conductivity of at least about 0.025 Cal/cm-sec.  |
| Preferably, the inner peripheral length of at least one of said apertures is unequal to the inner    |
| peripheral length of at least one adjacent aperture. Further, the article preferably has a           |
| compressive yield of not more than about 10 percent.   |
